When you first open up the app, there will be a display of the options on the menu along with the prices. Each stepper will increase the number displayed on the left side of it and that will determine the number of that specific item (Quantity). If you are satisfied with the amount of items that you want, you will have to click add and that will add it to the cart.

In the cart of the app, it will show the amount of items that you have in the cart along with the amount of each specific drink that you want. Additionally after adding to the cart, it will show you the total cost of all the items. To confirm the order, it will need an address input which will be used in the map tab and actually have items in the cart to officially confirm the order. The remove buttons on the side of each item will remove all of it and deduct accordingly from the number of items and total cost.

Here is the contact us page which takes in the input of name, email, subject, and the message. After hitting submit, it will popup the MFMailComposeViewController which then allows you to submit the email. The clear button will clear all the text fields and reset them.

In the maps tab, it will display an ETA of minutes after you hit confirm in the cart area with a valid address and hitting calculated distance. The map will show you the route and the estimated time of arrival of the delivery driver along with 10 extra minutes to simulate a prep time for the order. There is also a cancel button which will clear everything from the cart, reset the estimated time, and reset the address submitted for the map.
